

'Make in India' Paradigm – Roadmap for a Future Ready Naval Force

Organized by FICCI in association with Indian Navy

18-19 April 2016

Autonomous Underwater Vehicles

Dr. Manu Korulla

AUV VISION

Taking 'Man Out of Water' from all dangerous and monotonous activities under water

- *Sense, track, identify, target and destroy an enemy*
- *Condition monitoring of underwater assets*
- *Pave way for sustainable ocean resource exploration*
- *Ocean environment monitoring*
 - *all autonomously*

- “Eyes and Ears” for the fleet away from fleet **(ISR)**
- Force multiplier – ASW, Combat support & **Combat Engagement**
- Represent u/w in the **network centric data compilation & assessment** process

Requirements of AUVs

- Claiming, holding, utilizing the ocean
 - Explore, exploit and protect maritime resources
- Security : Detecting, Deterring and Defeating
 - Coastal, littoral and blue water
- Condition monitoring of u/w assets

- **India's coastline: 7517 km**
- **Territorial waters = 12 nm**
- **Exclusive Economic Zone = 200 nm**
- **Area coverage ,EEZ= 23 lakhs sqkm**

Naval Capability Requirements

- Unseen but on scene (Stealth)
- Present when and where least expected
- ISR
- Oceanographic bathymetric surveys
- Battle space awareness and preparation
- Surface warfare
- Mine warfare
- Anti Submarine Warfare (ASW)
- Special Operations & Strike support
- Low Intensity Conflicts

The Solution – Autonomous Sea Vehicles

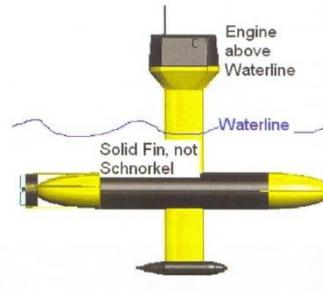

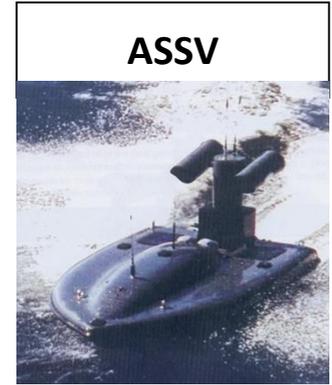

Ships are Manned !

Semi Submersibles

WIG

ASSV

Platforms – Technologies - Applications

Platforms

Large AUVs – Flat Fish

Large AUVs – Axisymmetric

Small AUVs

Gliders

Very Large AUVs

Autonomous Sea Surface Vehicles

Ocean Station and Sea Lab

Underwater Satellite Network

Technologies

Hydrodynamics

Hull Structure

Propulsion

Control

Navigation and Guidance

Power Systems

Electrical Systems

u/w Communication

FO Communication

Vehicle Sensors

Computer Systems

Launch & Recovery Systems

u/w Vision Systems

Imaging, Classification and Identification

Payload Management Systems

Buoyancy Management System

Artificial Intelligence

Applications

Tactical Intelligence Collection

Signal, Electronics, Measurement and Imaging Intelligence

Oceanography

Deployment of Leave Behind Sensors

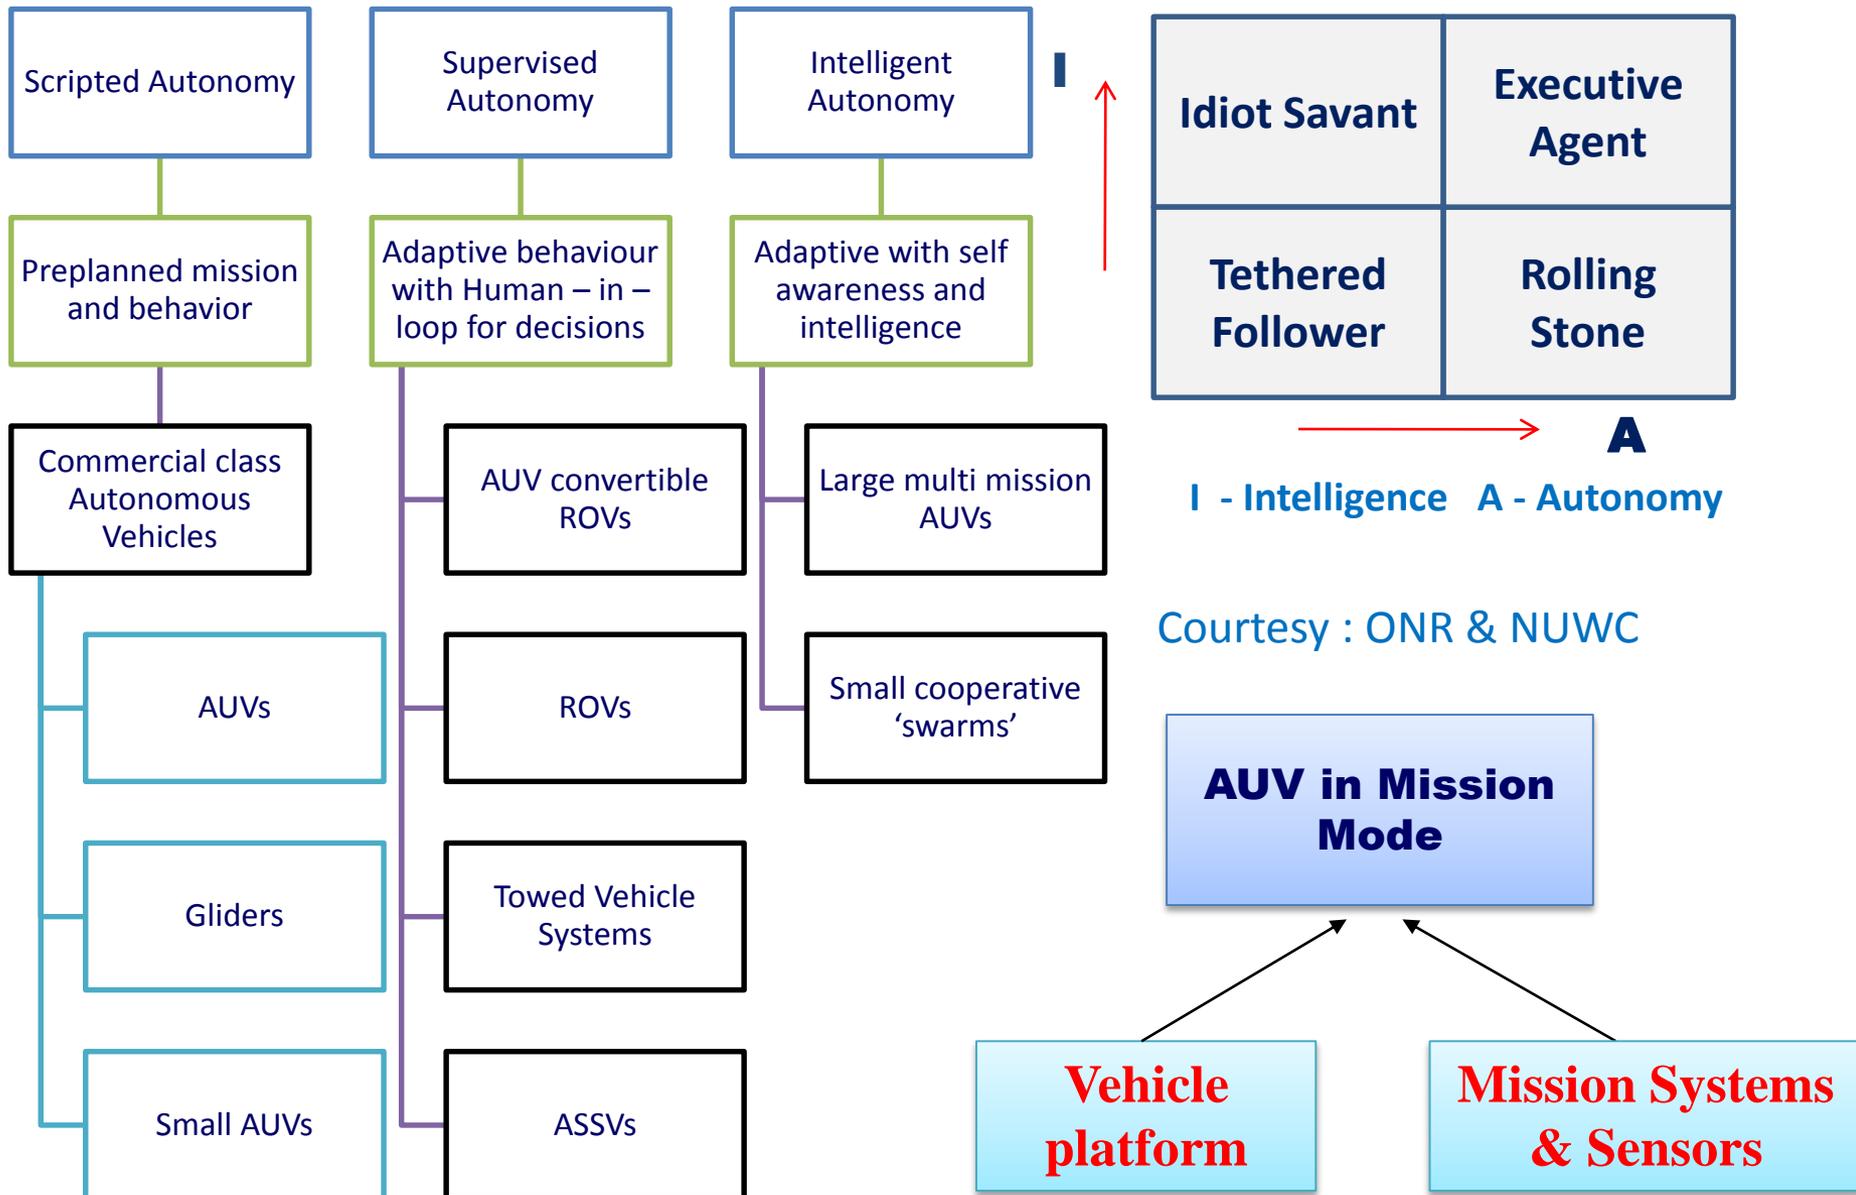

Harbour Surveillance Communication / Navigation Node

Undersea Test Platform

Infrastructure Monitor

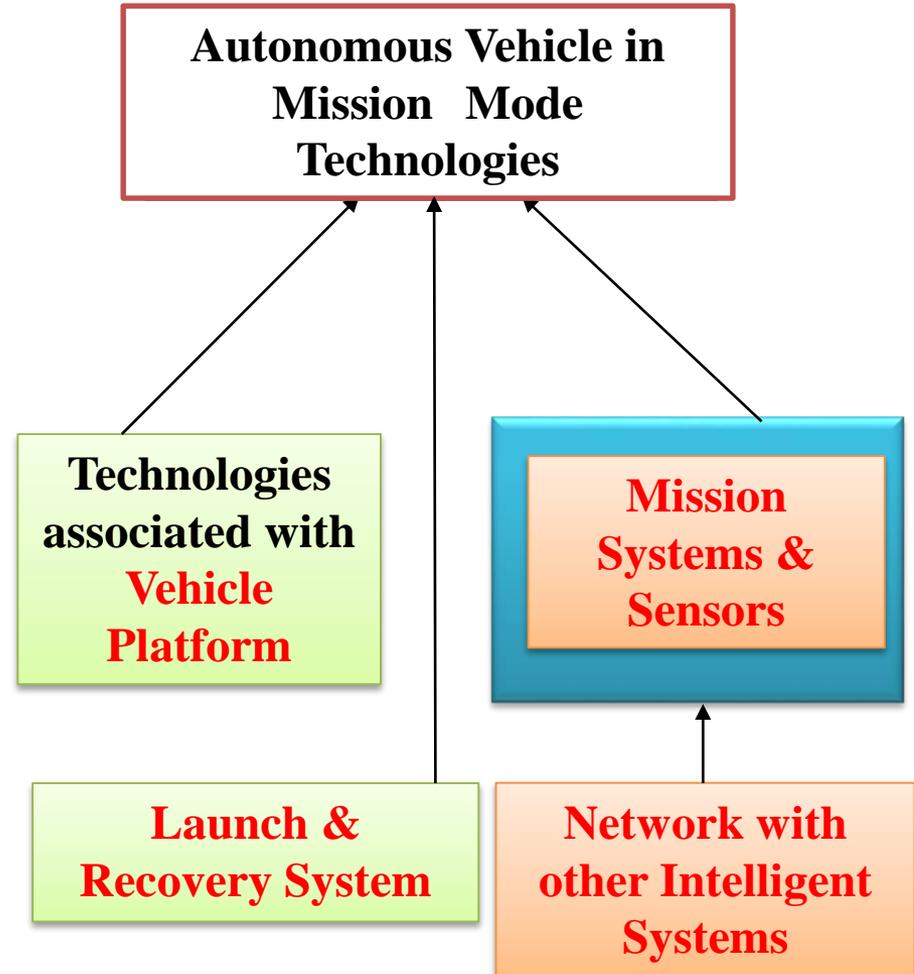

Maritime operations training

Autonomous Systems : Capabilities

SPECTRUM OF TECHNOLOGIES DEVELOPED

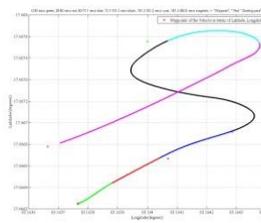

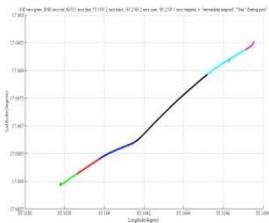

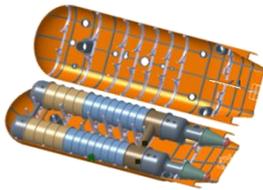

- ✓ Vehicle Architecture & **Hydrodynamics**
- ✓ Propulsion
- ✓ Hull Structure
- ✓ **Power**
- ✓ **Control, Navigation & Guidance**
- ✓ **Communication**
- ✓ Mission-critical Sensors
- ✓ Data , Signal & **Image Processing**
- ✓ Overall Autonomy
- ✓ **Launch & Recovery**
- ✓ **U/W Manipulator (for Work Class)**

AUV development at NSTL

AUV Sea trials

TDV: Key features & capabilities

- Flat fish shaped, free flooding, re-configurable
- Size: 4.6 m x 1.6 m x 0.7 m, Disp. : 1.5 Cum.
- Payload : 500 kg, positively buoyant with hovering
- OAS and INS, GPS & DVL aided navigation
- Underwater and surface comm. , U/W Camera and lights
- Normal and emergency recovery aids

Achievements

- HSTT trials , Field trials and sea trials
- LARS and AUV release mechanism
- AUV center established
- ECIL as concurrent engineering partner

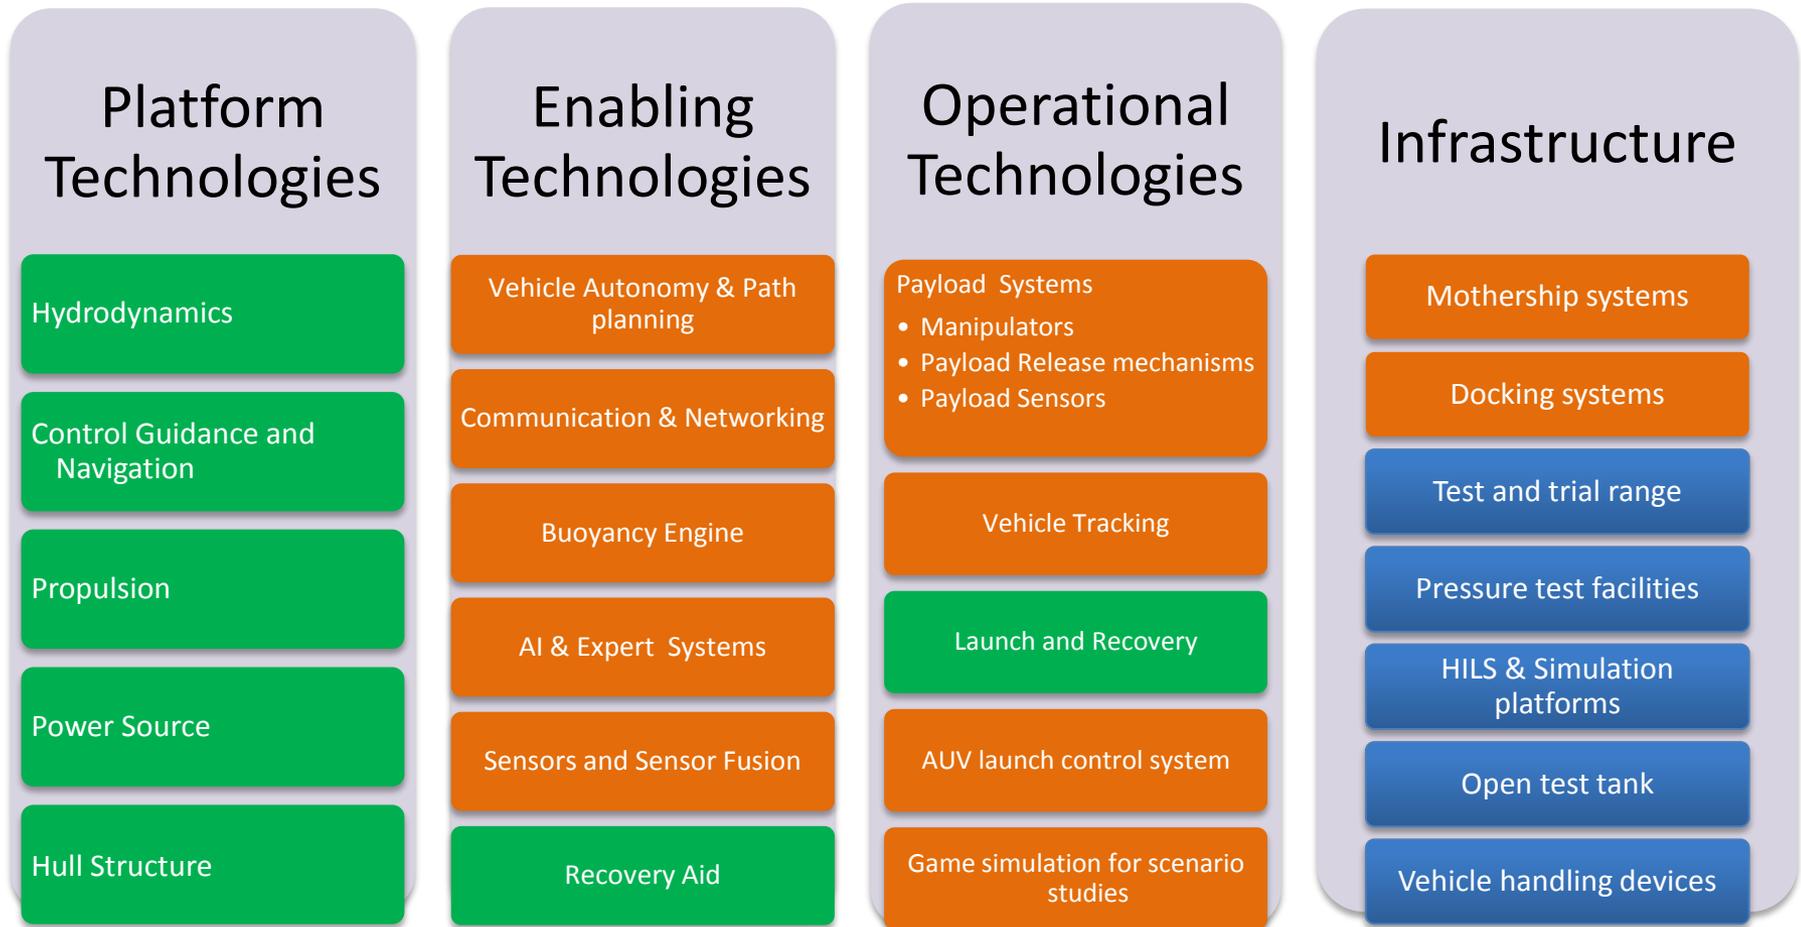

Applications

- Target for u/w exercises & deployment of leave behind sensors
- For surveillance & Oceanographic surveys

Technologies Developed & ongoing research for AUV at NSTL

Technologies Developed

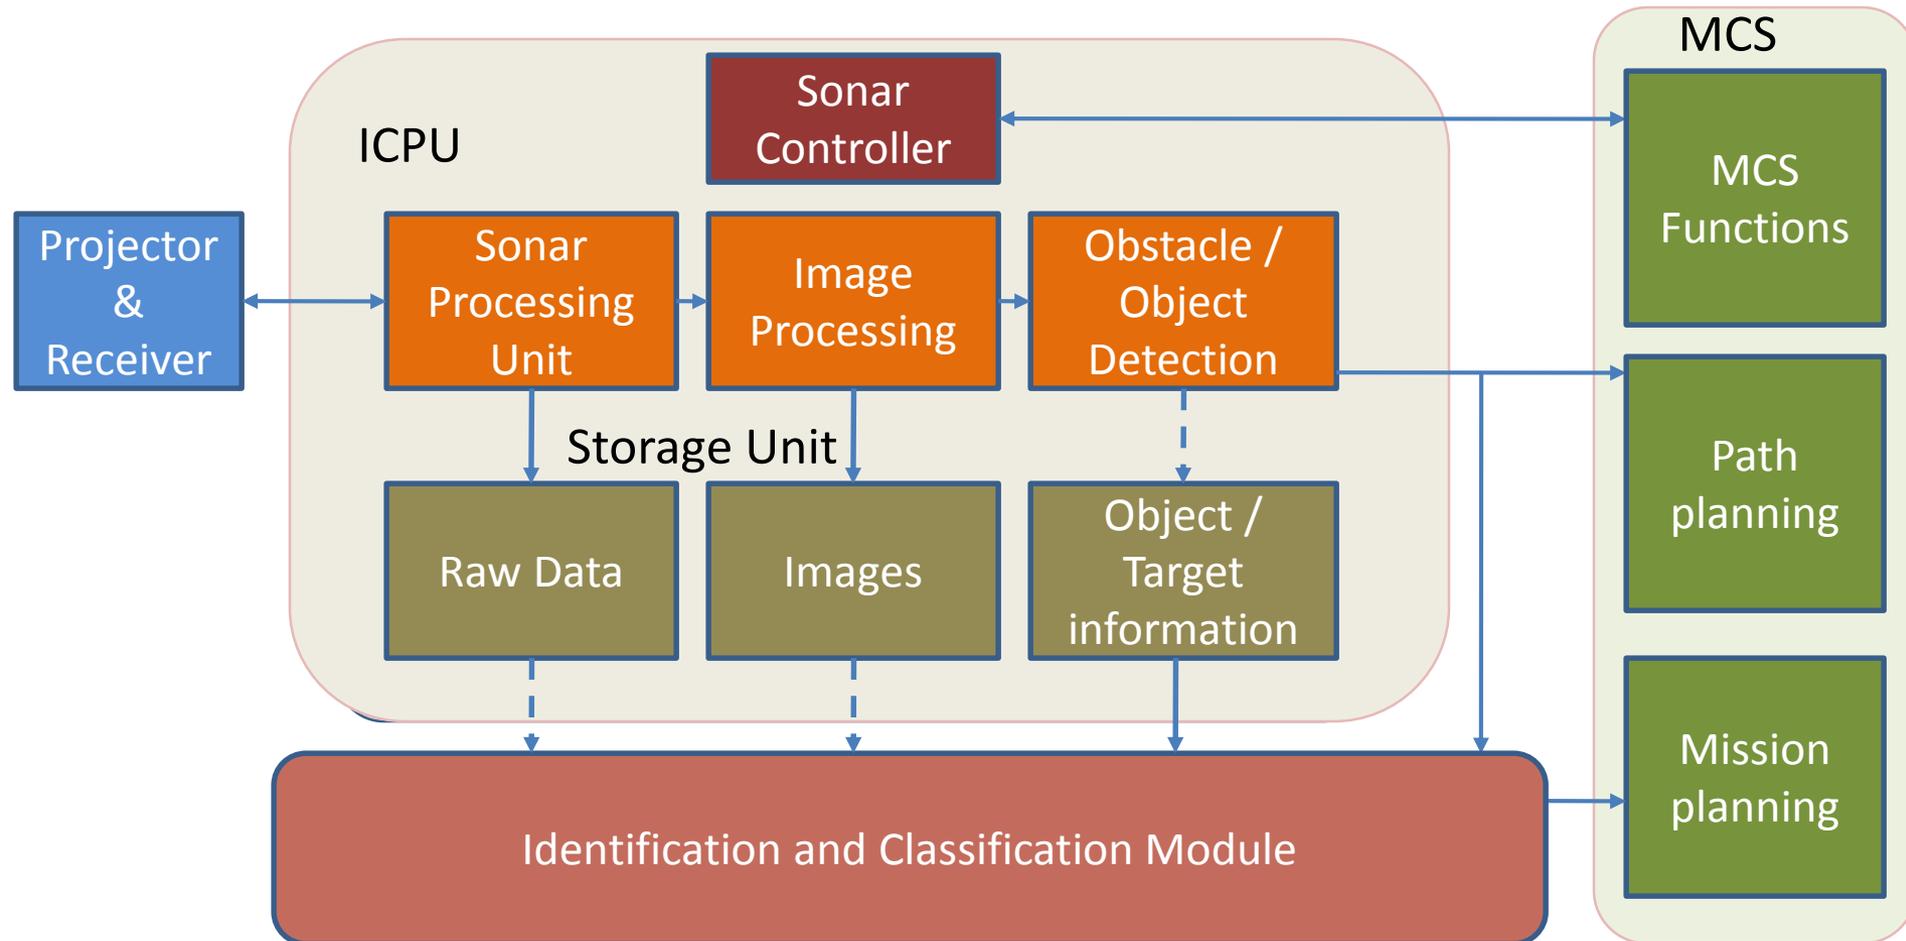

Ongoing research

Facilities

Decision making

- Obstacle Avoidance Sonar
- Identification and Classification

RECOVERY AIDS

Smoke Marker

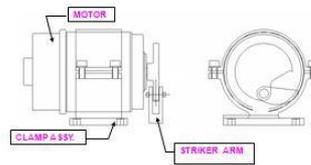

- Electrical signal fed to squib through IIRS
- Ignites and burns the smoke pellets
- Generates thick orange Colour smoke

Voltage : 28 volts
 Current : 0.2 Amps
 No of items in AUV : 1No
 Time of operation: 90 Sec.
 Weight : 3.5 Kg
 Vehicle position : 2 m depth
 in water

Noise Maker

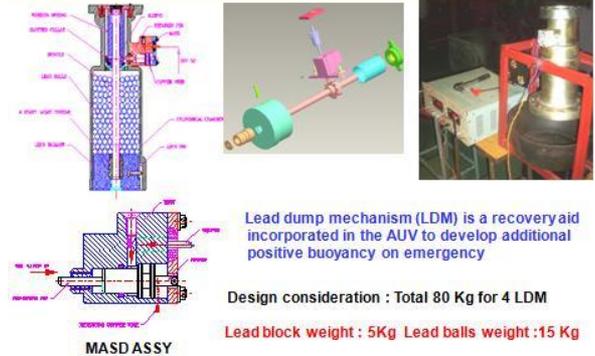

Noise maker produce the noise continuously on run termination

DC Rattler Motor
 Voltage : 28 volts
 Current : 3 Amps
 No of items in AUV : 1No
 Running time ≥ 24 hours
 Weight : 1.3 Kg

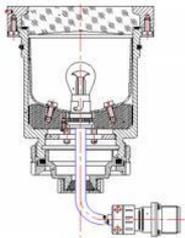

Lead Dump Mechanism

Lead dump mechanism (LDM) is a recovery aid incorporated in the AUV to develop additional positive buoyancy on emergency

Design consideration : Total 80 Kg for 4 LDM
 Lead block weight : 5Kg Lead balls weight :15 Kg

Flasher

- Flasher is used for identification of the AUV at the end of the run after surfacing
- In the case of recovery of AUV at night by emitting the beam of light.

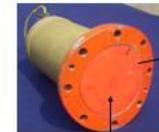

Voltage : 28 volts
 Current : 3 Amps
 No of items in AUV : 1No
 Emitting time : 24 hours
 Weight : 2.6 Kg

Sunken AUV Recovery Mechanism

Rope from Recovery drum

Buoy with 2 mm dia. rope With triggering mechanism

Movable mechanism with Kevlar rope

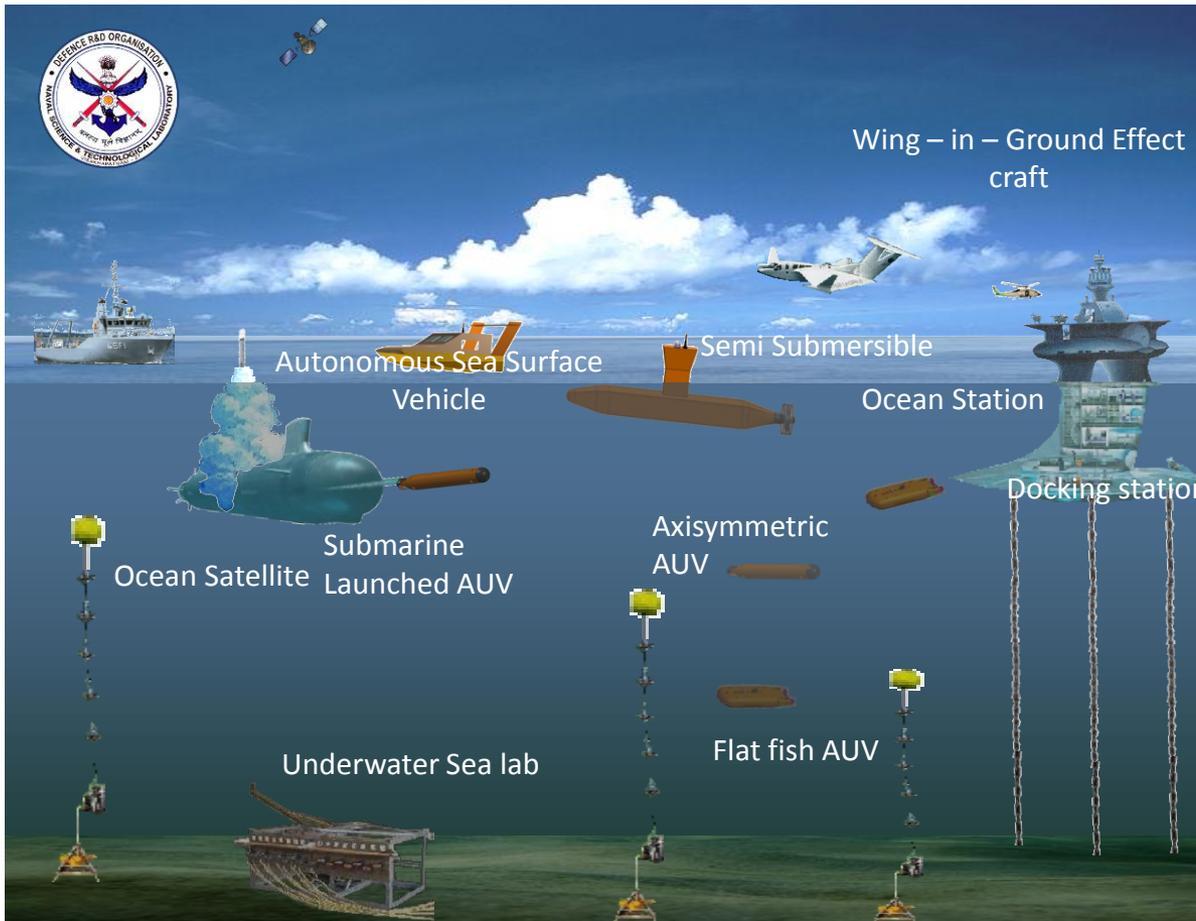

AUV

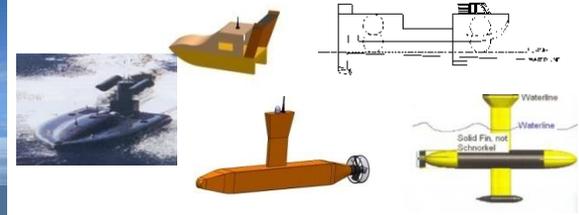

Voltage : 28 volts
 Current : 3 Amps
 No of items in AUV : 1No
 Running time : 24 hours
 Weight : 3.5 Kg

Network class AUVs and systems

- Surface Layer AUV
- Interior Layer AUV
- Bottom Layer systems

Surface Layer AUV

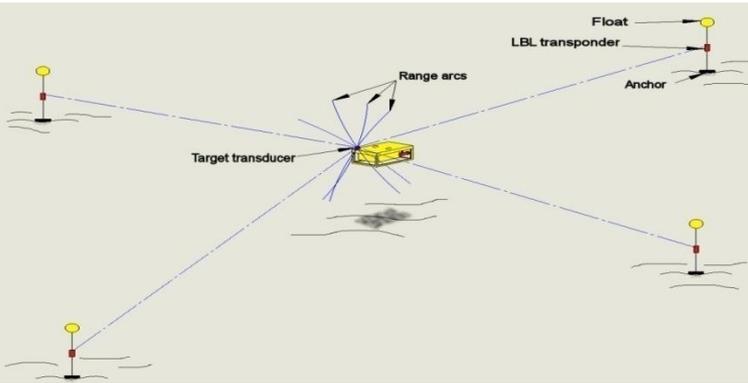

Interior Layer AUV

Bottom Layer systems

Technologies for networked operation of AUVs

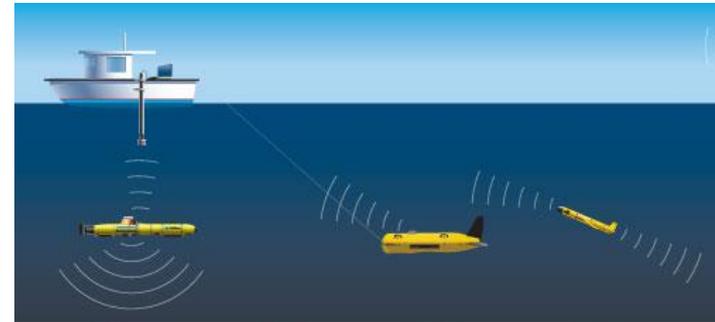

LBL system

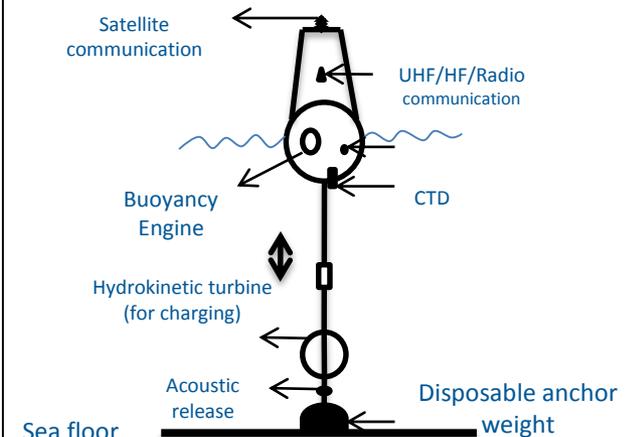

- Fixed / moored transponder arrays placed at regular intervals at known global coordinates
- Transducers placed at vehicle
- Vehicle position localization

USBL system

- USBL system deployed from a ship or stationary vessel
- Transponders placed at vehicles
- Vehicle location through triangulation and localization

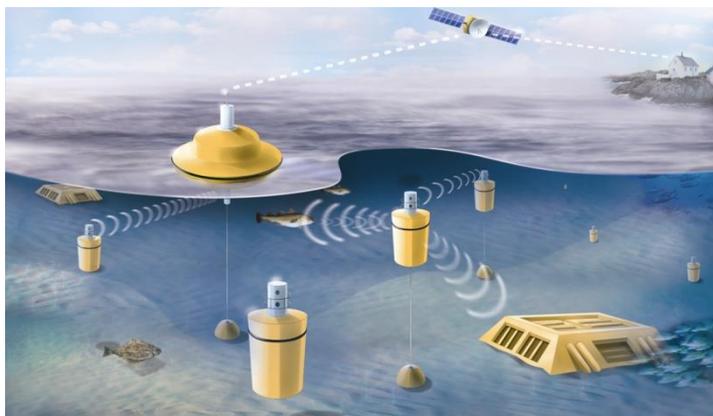

Underwater satellites

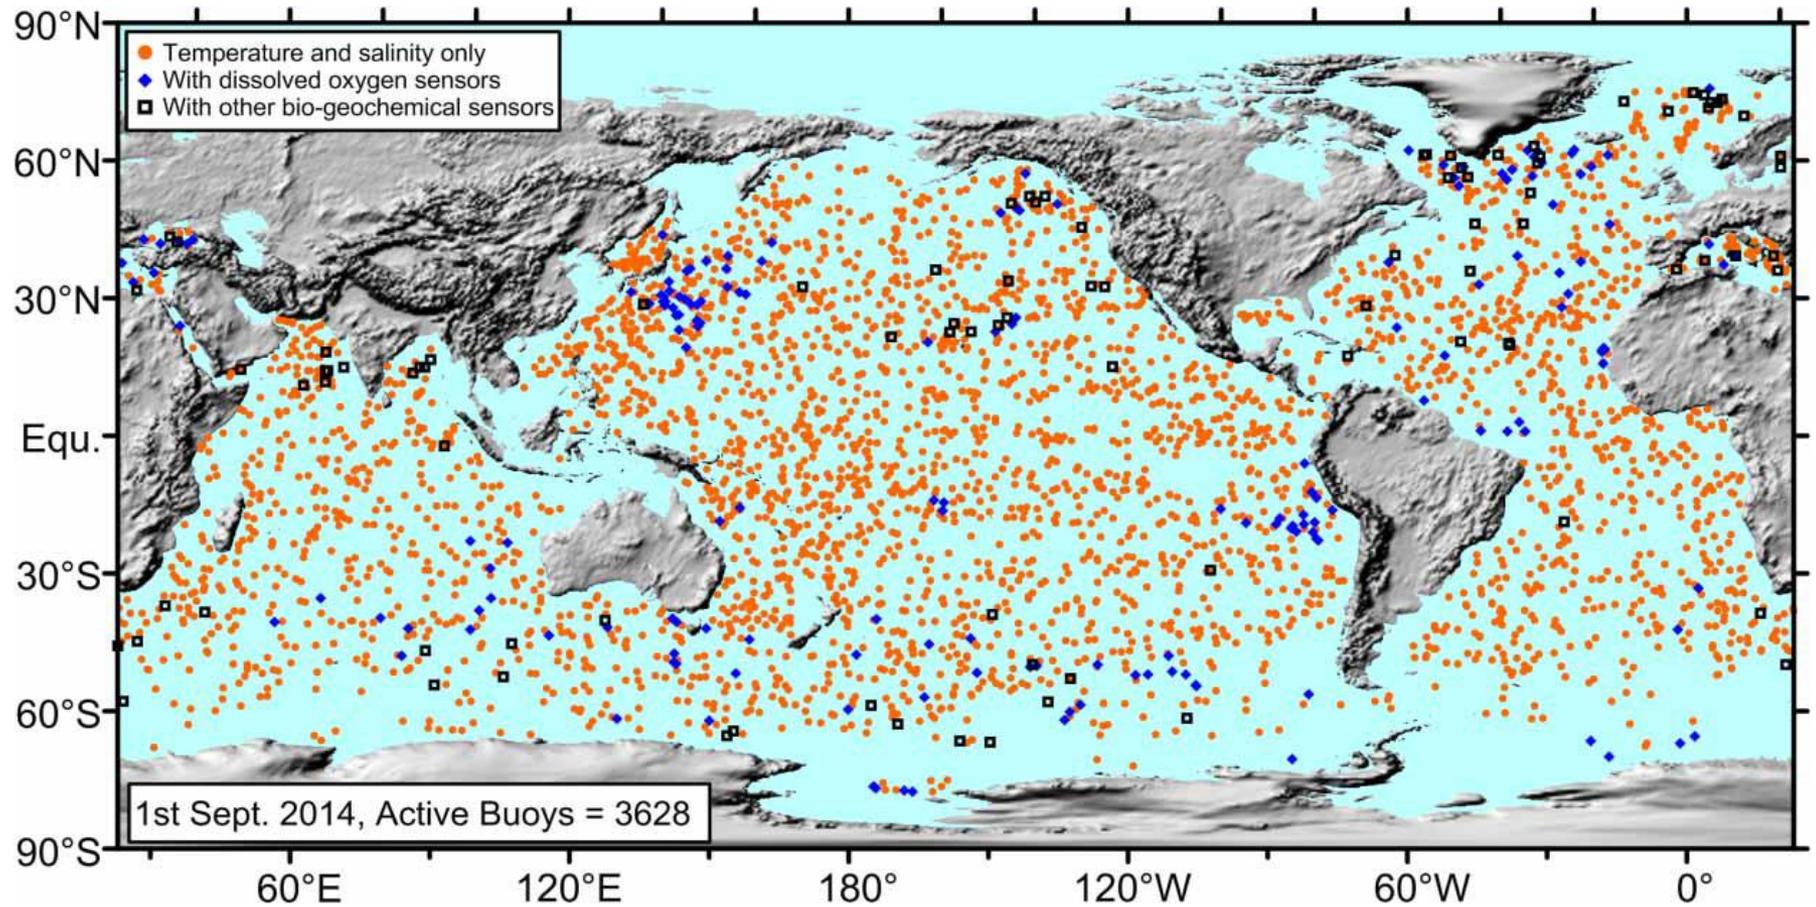

DP buoys

- Stationed on the sea surface
- Receives information from underwater sensors acoustically and transmits to satellite / ground station / mothership

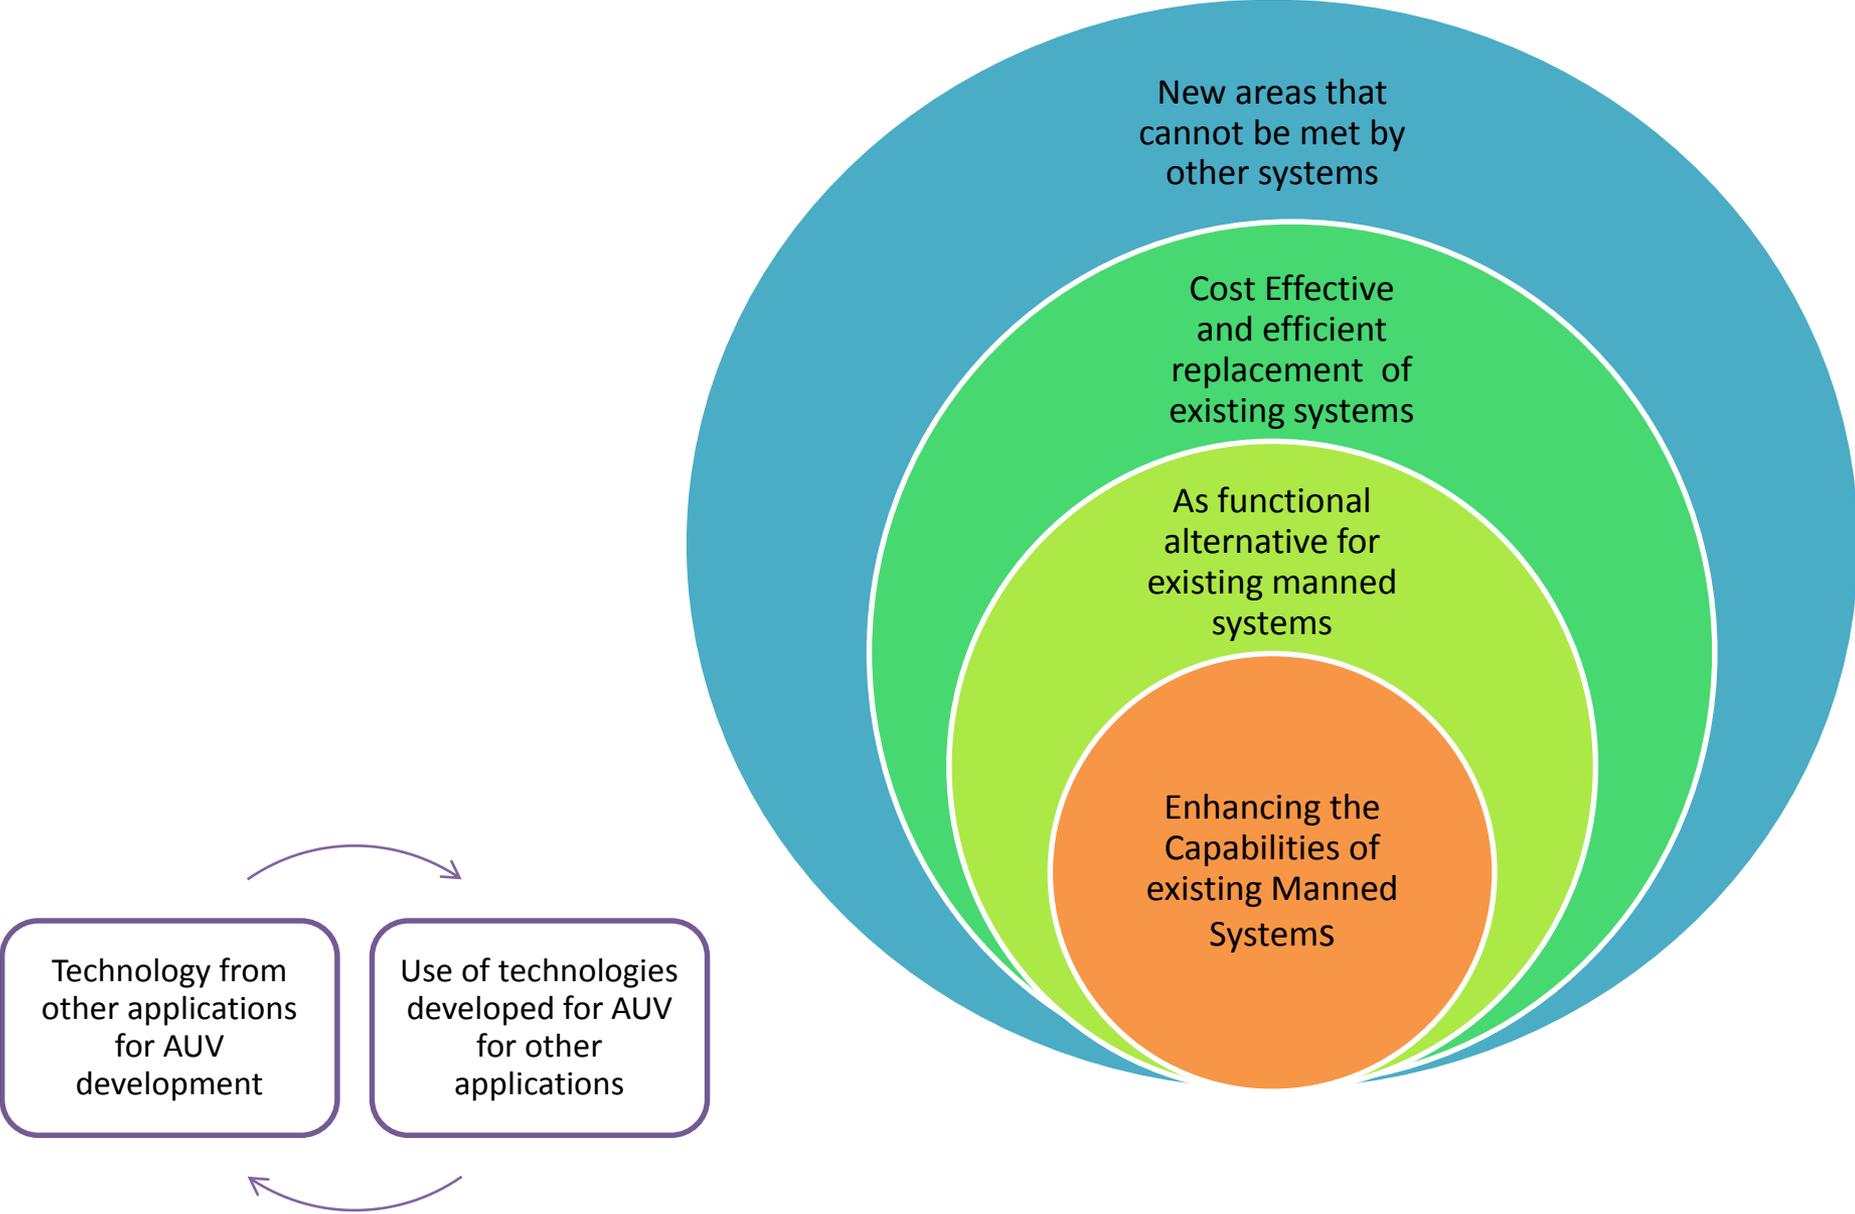

Ocean Information Grid

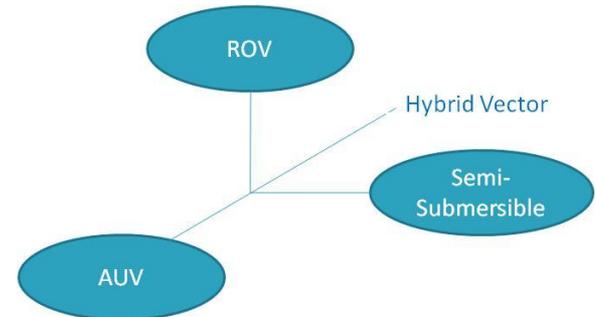

Various ocean sensors and buoys deployed globally

Strategy for deployment of unmanned sea systems

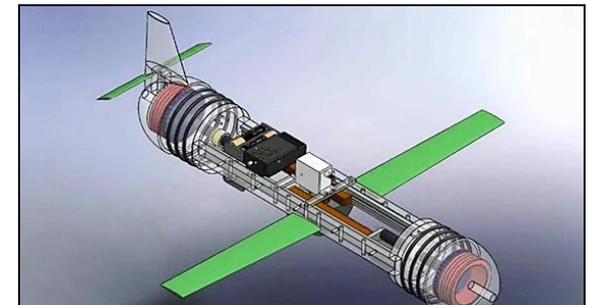

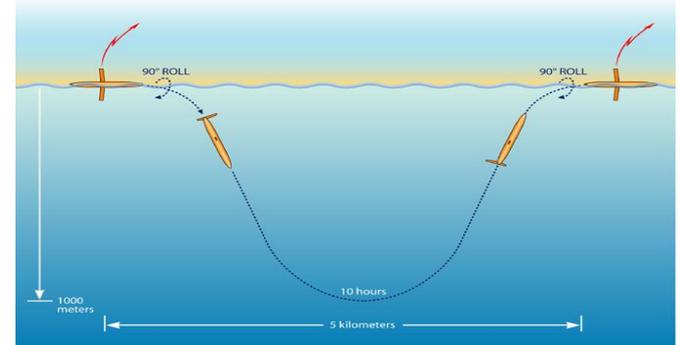

System trends

- Platforms
 - Large multi role capable AUVs
 - Small AUV with cooperative navigation operating in 'swarms'
 - Low drag designs and miniaturization
 - Autonomy: Increased level of AI with self learning capabilities and sensor fusion
 - Biologically inspired propulsion
 - U/w Gliders (24 X 7)
 - Trends in propulsion & power
 - Energy efficient power sources
 - Renewable energy sources
 - Digestive systems
 - Biologically inspired propulsion
 - Self deployed and recovered AUVs
 - Reusable / Disposable system
- Trends in modes of operation
 - ROV
 - AUV & ASSV
 - Hybrid

Underwater gliders

- U/w Gliders are
 - Small Size (1 – 2 meter)
 - Long Endurance (upto 6 months)
 - Low Speed (about 1m/s)
 - Low cost.
 - Minimum power consumption (1 watt on Avg.)
- Buoyancy driven gliders can follow a saw-tooth pattern patter across ocean depth, periodically they transmit the data collected by onboard sensors to mother ship or shore by satellite communication. Gliders are extremely stealthy. They are quite, with very low self-noise, small acoustic cross section and leave a practically invisible wake.

Amphibian vehicles

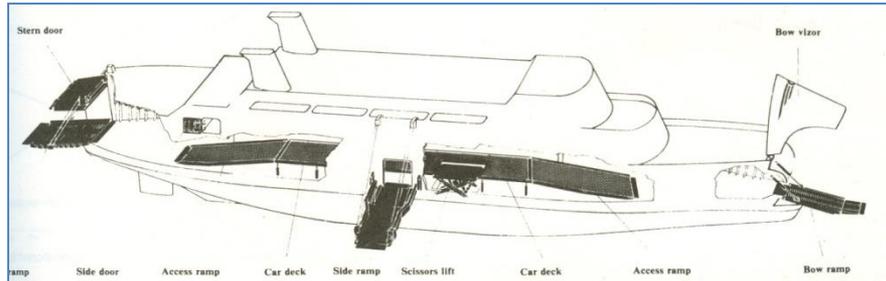

VIDEO

Courtesy: NRB

Way ahead

- AUV carriers (like aircraft carriers) that can fly in and fly out AUVs to and from the theater of operation

- AUVs that can fly in and out of mother ship to the sea
- Amphibians (land, air, sea surface and U/W)
- Networked systems with Ocean satellites, ocean Stations and sea lab

Conclusion

- Robust, mature COTS, ROV, AUV and Semi-Submersible Autonomous Vehicles and boats have arrived.
- Robotic Vehicles can be moved to theatres of operation by air.
- They carry sensor suites with the same capabilities as ships.
- They provide standoff.
- They are relatively low cost and keep personnel out of harm's way.
- They can be linked via shore, air, satellite or vessels of opportunity.

THANK YOU
